The **S&P 500 Index** is a broad-based, unmanaged measurement of changes in stock market conditions based on the average of 500 widely held common stocks.

The **Russell 2000 Index** is an index measuring the performance approximately 2,000 small-cap companies in the Russell 3000 Index, which is made up of 3,000 of the biggest U.S. stocks.

The **Russell 3000 Index** measures the performance of the largest 3000 U.S. companies representing approximately 98% of the investable U.S. equity market.

The **MSCI EAFE Index** is an unmanaged free float-adjusted market capitalization index that is designed to measure the equity market performance of developed markets, excluding the US & Canada.

The **BNY Mellon Classic ADR Index** combines the over the counter (OTC) traded ADRs with exchange-listed ADRs bringing transparency to the available universe of American Depositary Receipts, including those issued by many of the world's premier companies.

The **MSCI Korea Index** is designed to measure the performance of the large and mid cap segments of the South Korean market. With 107 constituents, the index covers about 85% of the Korean equity universe.

The **Barclays Capital Aggregate Bond Index** measures the performance of the U.S. investment grade bond market.

The **Barclays 1-3 Month U.S. Treasury Bill Index** includes all publicly issued zero-coupon U.S. Treasury Bills that have a remaining maturity of less than 3 months and more than 1 month, are rated investment grade, and have \$250 million or more of outstanding face value.

The **Barclays U.S. High Yield Index** is an unmanaged index considered representative of the universe of U.S. fixed rate, non investment grade debt.

One cannot invest directly into an index.

A **long position** is the purchase of an investment with the expectation that it will rise in value.

A **short position** is the sale of a borrowed investment with the expectation that it will decline in value.

Duration measures (in years) the sensitivity of the price of a fixed-income investment to a 1% change in interest rates.

The **Beta** is a measure of the volatility, or systematic risk, of a security or a portfolio in comparison to the market as a whole. Beta is used in the capital asset pricing model (CAPM), a model that calculates the expected return of an asset based on its beta and expected market returns.

R-Squared is a statistical measure that represents the percentage of a fund or security's movements that can be explained by movements in a benchmark index.

Standard Deviation is a measure of the dispersion of a set of data from its mean. The more spread apart the data, the higher the deviation. Standard deviation is calculated as the square root of variance.

An **Annualized Return** is the return an investment provides over a period of time, expressed as a time-weighted annual percentage. Sources of returns can include dividends, returns of capital and capital appreciation. The rate of annual return is measured against the initial amount of the investment and represents a geometric mean rather than a simple arithmetic mean.

A **Cumulative Return** is the aggregate amount that an investment has gained or lost over time, independent of the period of time involved. Presented as a percentage, the cumulative return is the raw mathematical return.

The **Alpha** is a measure of performance on a risk-adjusted basis. Alpha takes the volatility (price risk) of a fund and compares its risk-adjusted performance to a benchmark index. The excess return of the fund relative to the return of the benchmark index is a fund's alpha.

The **Sharpe Ratio** is developed by Nobel laureate William F. Sharpe to measure risk-adjusted performance. The Sharpe ratio is calculated by subtracting the risk-free rate - such as that of the 10-year U.S. Treasury bond - from the rate of return for a portfolio and dividing the result by the standard deviation of the portfolio returns.

The **Up-Market Capture Ratio** is a statistical measure of an investment manager's overall performance in up-markets. The up-market capture ratio is used to evaluate how well an investment manager performed relative to an index during periods when that index has risen. The ratio is calculated by dividing the manager's returns by the returns of the index during the up-market, and multiplying that factor by 100.

The **Down-market Capture Ratio** is a statistical measure of an investment manager's overall performance in down-markets. The down-market capture ratio is used to evaluate how well or poorly an investment manager performed relative to an index during periods when that index has dropped. The ratio is calculated by dividing the manager's returns by the returns of the index during the down-market and multiplying that factor by 100.

The **Maximum Drawdown** is a peak-to-trough decline during a specific record period of an investment, fund or commodity. A drawdown is usually quoted as the percentage between the peak and the trough.

An investment in one of the Funds may be subject to domestic equity, international equity, fixed income, derivatives/options, leverage, short selling, underlying funds, and/or cannabis risk -- including the possible loss of principal amount invested. **These Funds may not be suitable for all investors.**

Shares are bought and sold at market price (closing price) not NAV and are not individually redeemed from the Fund. Market price returns are based on the midpoint of the bid/ask spread at 4:00pm Eastern Time (when NAV is normally determined), and do not represent the return you would receive if you traded at other times. Holdings and allocations are subject to risks and to change.

Before investing you should carefully consider the Fund's investment objectives, risks, charges and expenses. This and other information is in the prospectus, a copy of which may be obtained by visiting the Fund's website at www.AdvisorShares.com. Please read the prospectus carefully before you invest.
