

## Investment Strategy

BKCH invests in equity securities of companies using and developing digital storage and recordkeeping, via cloud computing and emerging blockchain technology. More than cryptocurrency, blockchain's seamless storage, transmission and authentication of assets, information and units of record may revolutionize how we buy, sell, decide, and share. BKCH uses a quantitative process to select stocks and a technical analysis overlay for entering and exiting positions in the portfolio. BKCH can serve as a portion of an aggressive growth equity allocation in a diversified portfolio.

## Investment Growth

**Before investing you should carefully consider the Fund's investment objectives, risks, charges and expenses. This and other information is in the prospectus, a copy of which may be obtained by visiting the Fund's website at [www.AdvisorShares.com](http://www.AdvisorShares.com). Please read the prospectus carefully before you invest. Foreside Fund Services, LLC, distributor.**

There is no guarantee that the Fund will achieve its investment objective. An investment in the Fund is subject to risk, including the possible loss of principal amount invested. When the Fund focuses its investments in a particular industry or sector, financial, economic, business, and other developments affecting issuers in that industry, market, or economic sector will have a greater effect on the Fund than if it had not done so. Market or economic factors impacting technology companies and companies that rely heavily on technological advances could have a major effect on the value of the Fund's investments. Shares of the Fund may trade above or below their net asset value ("NAV"). The trading price of the Fund's shares may deviate significantly from their NAV during periods of market volatility. There can be no assurance that an active trading market for the Fund's shares will develop or be maintained. In addition, equity markets tend to move in cycles which may cause stock prices to fall over short or extended periods of time. Other Fund risks include market risk, liquidity risk, large cap, mid cap, and small cap risk. Please see prospectus for details regarding risk.

Shares are bought and sold at market price (closing price) not net asset value (NAV) and are not individually redeemed from the Fund. Market price returns are based on the midpoint of the bid/ask spread at 4:00 pm Eastern Time (when NAV is normally determined) and do not represent the return you would receive if you traded at other times.

The S&P 500 Index is a broad-based, unmanaged measurement of changes in stock market conditions based on the average of 500 widely held common stocks. One cannot invest directly in an index. \*\*This custom benchmark represents a blend of the GICS Technology Sector Index and the GICS Consumer Discretionary Sector Index; the Global Industry Classification Standard (GICS®) was developed by S&P Dow Jones Indices. Morningstar Technology Category portfolios buy high-tech businesses in the U.S. or outside of the U.S. Most concentrate on computer, semiconductor, software, networking, and Internet stocks. A few also buy medical-device and biotechnology stocks, and some concentrate on a single technology industry. Alpha measures the risk-adjusted premium an investment earns above its benchmark. Beta measures the volatility of a security or a portfolio in comparison to the entire market. Standard Deviation measures the dispersion of a set of data from its mean and is calculated as the square root of variance. Information Ratio measures the active return of the manager's portfolio divided by the amount of risk that the manager takes relative to the benchmark. Sortino Ratio measures the excess return over the risk-free rate divided by the downside semi-variance, and so it measures the return to "bad" volatility. Sharpe Ratio measures the average return minus the risk-free return divided by the standard deviation of return on an investment. Down Capture Ratio measures an investment manager's overall performance in down-markets. Correlation measures how two securities move in relation to each other. Tracking Error measures how closely a portfolio follows the index to which it is benchmarked. R2 measures the percentage of a fund or security's movements that can be explained by movements in a benchmark index.
